BMDM Report Generator Software Revision History

Version 1.03

The graph and text now show the correct information on the detail reports.

List index out of bound errors will no longer be displayed. Previously, when previewing a discharge report that didn't have any discharge current and the OV/I graph was selected, an index out of bounds error would be generated. Also, when previewing OV/I graph without tabular reports selected, the error would be generated.

Version 1.02

Multiple history and resistance readings made on the same day can be accessed. Previously, only one of each reading per day could be accessed.

On Discharge Report, each report type has its own tab. This eliminates the problem of reports dropping the last page or not appearing at all.

The Discharge Report has an Include Cell Memo option.

Discharge Report | Cell Summary shows the date of the resistance readings.

The Discharge Report has a note indicating that resistance readings are in microhms (μohms).

Using Import, DOS discharge files can be imported into the database.

Online help is available.

The Alarm Report indicates the peak value to the millivolt level.
